# Relational Algebra Chapter 4

#### ECS 165A – Winter 2020

Mohammad Sadoghi
Exploratory Systems Lab
Department of Computer Science

## Relational Query Languages

- Query languages: Allow manipulation and retrieval of data from a database.
- \* Relational model supports simple, powerful QLs:
  - Strong formal foundation based on logic.
  - Allows for much optimization.
- Query Languages != programming languages!
  - QLs not expected to be "Turing complete".
  - QLs not intended to be used for complex calculations.
  - QLs support easy, efficient access to large data sets.

## Formal Relational Query Languages

- Two mathematical Query Languages form the basis for "real" languages (e.g. SQL), and for implementation:
  - <u>Relational Algebra</u>: More operational, very useful for representing execution plans.
  - <u>Relational Calculus</u>: Lets users describe what they want, rather than how to compute it. (Non-operational, <u>declarative</u>.)

#### Preliminaries

- \* A query is applied to *relation instances*, and the result of a query is also a relation instance.
  - Schemas of input relations for a query are fixed (but query will run regardless of instance!)
  - The schema for the *result* of a given query is also fixed! Determined by definition of query language constructs.

## Example Instances

"Sailors" and "Reserves" relations for our examples.

**S1** 

-	sid	sname	rating	age
4	22	dustin	7	45.0
	31	lubber	8	55.5
4	58	rusty	10	35.0

*S*2

sid	sname	rating	age
28	yuppy	9	35.0
31	lubber	8	55.5
44	guppy	5	35.0
58	rusty	10	35.0

R1

sid	bid	<u>day</u>
22	101	10/10/96
58	103	11/12/96

## Relational Algebra

- \* Basic operations:
  - <u>Selection</u> ( $\sigma$ ) Selects a subset of rows from relation.
  - <u>Projection</u>  $(\Pi)$  Deletes unwanted columns from relation.
  - Cross-product ( $\times$ ) Allows us to combine two relations.
  - <u>Set-difference</u> ( ) Tuples in reln. 1, but not in reln. 2.
  - *Union* ( ∪ ) Tuples in reln. 1 and in reln. 2.
- \* Additional operations:
  - Intersection, join, division, renaming: Not essential, but (very!) useful.
- \* Since each operation returns a relation, operations can be *composed*! (Algebra is "closed".)

## Projection

- Deletes attributes that are not in projection list.
- \* Schema of result contains exactly the fields in the projection list, with the same names that they had in the (only) input relation.
- Projection operator has to eliminate duplicates! (Why??)
  - Note: real systems typically don't do duplicate elimination unless the user explicitly asks for it. (Why not?)

sname	rating
yuppy	9
lubber	8
guppy	5
rusty	10

 $\pi_{sname,rating}(S2)$ 

age 35.0 55.5

 $\pi_{age}(S2)$ 

#### Selection

- \* Selects rows that satisfy *selection condition*.
- No duplicates in result! (Why?)
- \* *Schema* of result identical to schema of (only) input relation.
- \* Result relation can be the input for another relational algebra operation!

  (Operator composition.)

52	<u>sid</u>	sname	rating	age
	28	yuppy	9	35.0
	31	lubber	8	55.5
	44	guppy	5	35.0
	58	rusty	10	35.0

sid	sname	rating	age
28	yuppy	9	35.0
58	rusty	10	35.0

$$\sigma_{rating>8}(S2)$$

sname	rating
yuppy	9
rusty	10

$$\pi_{sname,rating}(\sigma_{rating} > 8(S2))$$

## Union, Intersection, Set-Difference

- \* All of these operations take two input relations, which must be *union-compatible*:
  - Same number of fields.
  - Corresponding' fields have the same type.
- \* What is the *schema* of result?

 $S1 \cap S2$   $\begin{bmatrix} 31 \\ 58 \end{bmatrix}$ 

sid	sname	rating	age
31	lubber	8	55.5
58	rusty	10	35.0

$$S1-S2$$

sid	sname	rating	age
22	dustin	7	45.0

<u>sid</u>	sname	rating	age
22	dustin	7	45.0
31	lubber	8	55.5
58	rusty	10	35.0

sid	sname	rating	age
28	yuppy	9	35.0
31	lubber	8	55.5
44	guppy	5	35.0
58	rusty	10	35.0

*S*1

S2

sid	sname	rating	age
22	dustin	7	45.0
31	lubber	8	55.5
58	rusty	10	35.0
44	guppy	5	35.0
28	yuppy	9	35.0

 $S1 \cup S2$ 

### Cross-Product

<u>sid</u>	sname	rating	age	sid	<u>bid</u>	<u>day</u>		
22	dustin	7	45.0	22	101	10/10/96		
31	lubber	8	55.5	58	103	11/12/96		
58	rusty	10	35.0	R1				
\$1								

- \* Each row of S1 is paired with each row of R1.
- \* Result schema has one field per field of S1 and R1, with field names `inherited' if possible.
  - *Conflict*: Both S1 and R1 have a field called *sid*.

(sid)	sname	rating	age	(sid)	bid	day
22	dustin	7	45.0	22	101	10/10/96
22	dustin	7	45.0	58	103	11/12/96
31	lubber	8	55.5	22	101	10/10/96
31	lubber	8	55.5	58	103	11/12/96
58	rusty	10	35.0	22	101	10/10/96
58	rusty	10	35.0	58	103	11/12/96

■ Renaming operator:  $\rho$  ( $C(1 \rightarrow sid1, 5 \rightarrow sid2)$ ,  $S1 \times R1$ )

## Joins

sid	sname	rating	age	sid	<u>bid</u>	<u>day</u>		
22	dustin	7	45.0	22	101	10/10/96		
31	lubber	8	55.5	58	103	11/12/96		
58	rusty	10	35.0	R1				
<u>C1</u>								

\* Condition Join:

$$R\bowtie_{c} S = \sigma_{c}(R \times S)$$

(sid)	sname	rating	age	(sid)	bid	day
22	dustin	7	45.0	58	103	11/12/96
31	lubber	8	55.5	58	103	11/12/96

$$R\bowtie_{S1.sid < R1.sid} S$$

- \* Result schema same as that of cross-product.
- \* Fewer tuples than cross-product, might be able to compute more efficiently
- \* Sometimes called a *theta-join*.

<u>sid</u>	sname	rating	age	sid	bid	<u>day</u>	
22	dustin	7	45.0	22	101	10/10/96	
31	lubber	8	55.5	58	103	11/12/96	
58	rusty	10	35.0	R1			
01							

## Joins

\* <u>Equi-Join</u>: A special case of condition join where the condition *c* contains only *equalities*.

sid	sname	rating	age	bid	day
22	dustin	7	45.0	101	10/10/96
58	rusty	10	35.0	103	11/12/96

$$R\bowtie_{sid} S$$

- \* Result schema similar to cross-product, but only one copy of fields for which equality is specified.
- \* *Natural Join*: Equijoin on *all* common fields.

#### Division

Not supported as a primitive operator, but useful for expressing queries like:

Find sailors who have reserved <u>all</u> boats.

- $\bullet$  Let *A* have 2 fields, *x* and *y*; *B* have only field *y*:
  - $A/B = \{\langle x \rangle | \exists \langle x, y \rangle \in A \ \forall \langle y \rangle \in B \}$ • i.e., A/B contains all x tuples (sailors) such that for <u>every</u> y
  - i.e., *A/B* contains all *x* tuples (sailors) such that for *every y* tuple (boat) in *B*, there is an *xy* tuple in *A*.
  - *Or*: If the set of *y* values (boats) associated with an *x* value (sailor) in *A* contains all *y* values in *B*, the *x* value is in *A/B*.
- \* In general, x and y can be any lists of fields; y is the list of fields in B, and  $x \cup y$  is the list of fields of A.

## Examples of Division A/B

pno

s1	p2	
s1	p4	
s2	p1	
s2	p2	
s2	p4	
s3	p1	
s3	p2	
s3	p4	
s4	p1	
s4	p2	
s4	p4	

$$\begin{array}{c|c} & sno \\ \hline s2 \\ \hline s3 \\ \hline s4 \\ \\ \pi_{sno}(\pi_{sno}(A) \times B - A) \\ & \text{disqualified tuples} \end{array}$$

$$\pi_{sno}(A) \times B - A$$

$$\pi_{sno}(A) \times B$$

$$A/B = A - \pi_{sno}(\pi_{sno}(A) \times B - A)$$

A/B = A - disqualified tuples

## Expressing A/B Using Basic Operators

- Division is not essential op; just a useful shorthand.
  - (Also true of joins, but joins are so common that systems implement joins specially.)
- ❖ *Idea*: For *A*/*B*, compute all *x* values that are not `disqualified' by some *y* value in *B*.
  - *x* value is *disqualified* if by attaching *y* value from *B*, we obtain an *xy* tuple that is not in *A*.

Disqualified *x* values: 
$$\pi_{\chi}((\pi_{\chi}(A) \times B) - A)$$

A/B: 
$$\pi_{\chi}(A)$$
 – all disqualified tuples

Find names of sailors who've reserved boat #103

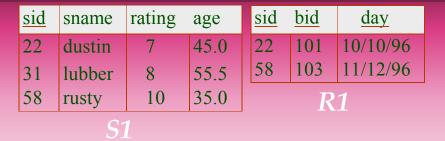

\* Solution 1: 
$$\pi_{sname}((\sigma_{bid=103}Reserves) \bowtie Sailors)$$

\* Solution 2: 
$$\rho(Temp1, \sigma_{bid=103}Reserves)$$

$$\rho(Temp2, Temp1 \bowtie Sailors)$$

$$\pi_{sname}(Temp2)$$

\* Solution 3: 
$$\pi_{sname}(\sigma_{bid=103}(Reserves \bowtie Sailors))$$

Find names of sailors who've reserved a red boat

Information about boat color only available in Boats; so need an extra join:

$$\pi_{sname}((\sigma_{color='red'}Boats) \bowtie Reserves \bowtie Sailors)$$

\* A more efficient solution:

$$\pi_{sname}(\pi_{sid}(\pi_{bid}(\sigma_{color='red'}Boats) \bowtie Reserves) \bowtie Sailors))$$

A query optimizer can find this, given the first solution!

<u>sid</u>	sname	rating	age	<u>sid</u>	<u>bid</u>	<u>day</u>		
22	dustin	7	45.0	22	101	10/10/96		
31	lubber	8	55.5	58	103	11/12/96		
58	rusty	10	35.0	R1				
<u>C1</u>								

Find sailors who've reserved a red or a green boat

\* Can identify all red or green boats, then find sailors who've reserved one of these boats:

$$\rho(Tempboats, (\sigma_{color='red' \lor color='green'}Boats))$$

$$\pi_{sname}(Tempboats \bowtie Reserves \bowtie Sailors)$$

- \* Can also define Tempboats using union! (How?)
- \* What happens if V is replaced by ^ in this query?

sid	sname	rating	age	sid	<u>bid</u>	day
22	dustin	7	45.0	22	101	10/10/96
31	lubber	8	55.5	58	103	11/12/96
58	rusty	10	35.0	R1		

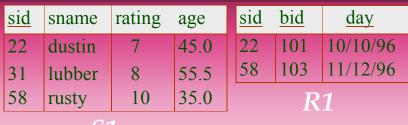

Find sailors who've reserved a red and a green boat

Previous approach won't work! Must identify sailors who've reserved red boats, sailors who've reserved green boats, then find the intersection (note that *sid* is a key for Sailors):

```
\rho(Tempred, \pi_{sid}((\sigma_{color='red'}Boats) \bowtie Reserves))

\rho(Tempgreen, \pi_{sid}((\sigma_{color='green'}Boats) \bowtie Reserves))

\pi_{sname}((Tempred \cap Tempgreen) \bowtie Sailors)
```

S1

#### Find the names of sailors who've reserved all boats

Uses division; schemas of the input relations to / must be carefully chosen:

$$\rho(Tempsids, (\pi_{sid,bid}Reserves)/(\pi_{bid}Boats))$$

$$\pi_{sname}(Tempsids \bowtie Sailors)$$

\* To find sailors who've reserved all 'Interlake' boats:

.... 
$$/\pi_{bid}$$
 ( $\sigma_{bname=Interlake}$  Boats)

## Summary

- The relational model has rigorously defined query languages that are simple and powerful.
- \* Relational algebra is more operational; useful as internal representation for query evaluation plans.
- \* Several ways of expressing a given query; a query optimizer should choose the most efficient version.
